

HUMAN

Editor's Note

At its core, architecture is a human act. Before it is a discipline, a profession, or a product, it is a response to shared needs; shelter, belonging, identity, and care. **Human**, the 25th issue of Paperspace, asks what unites us in a world increasingly shaped by speed, technology, and division, and how design might reconnect us to the values that first gave architecture meaning.

Across the issue, contributors explore architecture at the scale of people. From playful, 'fun' design that encourages delight and interaction, to quieter forms of architecture shaped by restraint, atmosphere, and presence, these pieces question what it truly means to design for humans. Rather than chasing novelty, they foreground spaces that are lived in, touched, and felt. Comfort, intuition, and emotion matter just as much as form.

Several works turn to material and craft as carriers of human knowledge. Through explorations of masonry and artisanal making, contributors reflect on the value of the hand, the weight of material, and the slow intelligence embedded in construction traditions. These practices are framed not as nostalgic gestures, but as ways of building meaning, continuity, and care into the built environment.

Human also addresses the social consequences of architecture. Contributions interrogate how spatial decisions can reinforce separation;

between public and private, inside and outside, privileged and marginalised, while offering alternative approaches grounded in accessibility, inclusivity, and shared use. In doing so, architecture is positioned as a tool for connection rather than division.

Ultimately, this issue is an optimistic reflection on unity. It celebrates architecture's ability to create moments of encounter, quiet refuge, and collective experience, reminding us that the most powerful spaces are often those that feel deeply, unmistakably human.

Past Meets Present

Photography competition

About the Competition

In collaboration with ACE Society and PhotoSoc, the theme of 'Past Meets Present' was explored under three different categories with the aim to capture the contrast between historic beauty and contemporary architecture. Pete Helm, award-winning architectural and interior design photographer, joined the judging panel, bringing an experienced point of view.

Best Contrast Shot - *Virochan Sivarupan*

Captures the most striking mix of historic and modern architecture which perfectly captures the theme of the competition.

Most Creative Perspective - *Harrison Sell*

Showcasing originality through unique angles, lighting, or other techniques that bring a fresh take to the theme.

Editorial Choice - *Romilly Middlemiss*

This photograph stood out due to the strong contrast between the two buildings. The small, traditional shrine in the foreground feels calm and delicate, whilst the crumbling apartment block adds a heaviness to the image. The longevity of Modern architecture compared to tradition and craft is brought to attention, something which is explored throughout this issue. The picture captures a quiet moment where two very different worlds sit side by side, and provides a reminder that being human is often about our differences, and the beauty that comes from them.

in Someone Else's Hands: the Culture we Touch and why we Ought to Get a Grip

By Emilia Noyce

Graphics by Lisa Kurdziel

Handles traditionally communicate ideas of safety, protection, connection, and the cultural values of a given era. Like many designed objects, they convey society's priorities in miniature—what it treasures, what it fears, what it aspires to. Looking at the handles around us today the messages become less inspiring. Sanitised panels, swipe cards, automated locks — they broadcast distance, convenience, and surveillance. They flatten experience, reduce interaction, and signal distrust rather than care. These small items express the society that produced them: transactional, controlled, and impersonal. It is tempting to accuse modern production and standardization of erasing creative delight. Yet this condemnation misses the point. As Lina Bo Bardi wrote, "To standardise means to extend the possibility, to make it possible that something for a few may be extended to many." You can mass produce beautiful objects. The diagnosis here is erosion of aspirational values. Standardisation does not preclude beauty; it enables equity, access, and care, and therefore can act as a tool to imbue aspiration to our streets. Nature itself relies on repetition and iteration, and great cities mirror this logic. Amsterdam's gabled facades, Bath's Palladian terraces, and the rhythmic windows and proportions of Paris gain their strength not through eccentricity, but through rhythm and collective unity. Buildings earn beauty not by isolating themselves, but by contributing to the streetscape, extending their form and character beyond their walls into the public realm. This principle extends beyond door handles to architecture as a whole. Cities are constructed not only from streets and squares, but from countless fragments - repeated forms that accumulate into something enduring. Every threshold, every street corner, every repeated window and roofline participates in an echo of expectation, memory, and engagement. The door handle is a fragment of this echo, a small monument we touch, learn from, and internalize. Architecture and all its elements function as a language, shaping human experience as much as they shelter. When design fails to communicate values worth internalizing, architects have a responsibility to intervene, to reimagine the ordinary, and to infuse the built environment with relevance, meaning, and charm. Nonetheless, handles are often treated as a

catalogue afterthought, a component to be "selected" rather than designed. By abdicating responsibility for the small, we weaken the integrity of the whole. Buildings are not experienced primarily in elevations or diagrams; they are lived through moments - small, sequential, personal. The handle is one of the first. To ignore it is to ignore the threshold between architecture as image and architecture as experience. To design it carefully is to acknowledge that the deepest meanings in buildings are often found in the parts we touch most lightly. Architecture often aspires to monumentality, but the true monuments are sometimes the smallest objects: the ones we touch without thinking, quietly accompanying the rituals of living. The door handle is one such monument: humble in form, persistent in meaning, a small permanence touched by thousands of hands.

Humans are unique in that we live largely by observation rather than instinct. We absorb the patterns of those around us, imitating without thinking; our accents and behaviours bend to the people we spend time with. Our personal culture is not "society" at large. It is our milieu - the network of people, ideas, and experiences we encounter daily. This process never stops - we are always internalising culture, whether we notice it or not, so how do we choose which culture to inhabit? Where do we find influences worth absorbing, and how do we surround ourselves with them? Social media, friendships, mentors, work, and study form currents flowing through us. These currents can be curated, arranged, and refined. What we absorb shapes us. What we interact with is what we become. Interact with handles that reflect generosity, craftsmanship, and care, and these values embed themselves subtly into your experience. Exceptional environments foster exceptional minds. Interact with shallow, hollow, or automated devices, and you internalize those qualities whether you intend to or not.

To live fully, we must curate our architectural milieu as we do our cultural one. Surround yourself with buildings, fragments, and streetscapes that challenge, inspire, and elevate. Let the architecture you touch embody values

worth internalizing. It is in these ordinary, intimate moments - the rotation of a knob, the push of a plate - that culture enters us most directly. Handles teach us a lesson about attention, care, and engagement. They remind us that architecture is not only about form or image, but about touch, ritual, and interaction. They are the interface between human and building, private and public, mundane and monumental. And in a world increasingly dominated by flat panels, surveillance devices, and automation, they are a rare opportunity for intimacy, expression, and meaning - a reminder that the architecture we inhabit can shape us, for better or worse, with every hand that passes over it.

the Back of Bath

By Sophie Peaucelle

Bath is a city known for its Georgian elevations. Recognisable by their Neoclassical symmetry and order, the façades were created as part of a wider plan to transform Bath into a fashionable spa town. Just like the Georgians that flocked there, the fronts expressed the perfect and glamorous life that they wanted to show the world, but like a mask, they hid a much more human back.

In the 18th century, John Wood the Younger and his predecessor designed many of the now famous Georgian buildings around Bath. This was all in the goal to create a perfect urban landscape, fit for the visiting upper class. However, he only designed the front of the terraces, then sold each plot to different contractors and builders. They would then design and build the rest of the house within the boundary, the only caveat being the front facade would have to match Wood's design.

This means the backs of iconic structures such as the Circus and the Royal Crescent completely contradict their clean exterior. Windows were placed where light was needed in the rooms behind and were not limited to a rigid grid. Despite the strictly even facades, each house has slightly different floor levels. The walls protrude as strict rectangles or occasionally as gentle curves. You might even spot some exterior staircases, precariously attached to the side of the building.

Most of the backs are hard to see, surrounded by neighbouring buildings all around. However, if you find yourself wandering the streets of Bath, you may be able to catch a glimpse. When walking around Victoria Park, take a peek through the gardens and you may be surprised by what you find.

the People Who Make

By Ella Turner

mason

noun

a person **skilled** in **building** from stone; a person who dresses **stone**

verb

to construct or **strengthen** with **masonry**

origins

Old French **masson**, of Frankish origin; perhaps related to Old English **macian** to make

A Medieval Mason was more than an individual renowned for their artisanal workmanship. They were first and foremost creative - the principal designer and Architect. The intrinsic connection between masonry and religion elevated the position to be almost one with God. The rise of mass developments and prefabricated buildings brings a question to mind; why have we lost our respect for these artisanal crafts?

Some of the most iconic imagery in Western Architecture was tirelessly chiselled out by trained and highly skilled artisans. The craft of stonemasonry is almost as old as civilization itself, dating back to the neolithic period. One can call back to the Egyptian empire and marvel at the feat of the pyramids or consider the longevity of the Inca and Mayan structures in Peru. Our current need for speed and efficiency limits the quality and lifeline of our structures. In a study completed by Heritage England, it was shown that Heritage Buildings are profoundly impactful to your wellbeing; they allow for a sense of connection with history and, by extension, one's community. The painstakingly created details of wooden carvings, stained glass and stonework undoubtedly create a sense of awe and admiration. Through designs that utilise natural lighting and sound strategies, the Masons and Architects of the past created precedents that can be modernised and utilised today.

A case study of one such impactful structure is the inimitable Wells Cathedral. Renowned for its West Front, the structure has been through endless phases of work to maintain its astonishing character. It is the heart of a bustling medieval city, with a history dating back to 705 AD. To this day, trained Stone Masons are employed to revive the sculptures, foliates and mouldings of this labyrinthine building. The extraordinary character of the Cathedral cannot be understated, with its vibrant history reflected in its once painted facade. Through sampling polychrome on the facades, Masons can unravel the past physically and help us understand more

about those who came before.

However, the trade is understaffed and underfunded, which is ironic given the national obsession with glorifying our heritage past. It is vital that our country respects, highlights, and champions 'dying' trades such as these. Stepping into places like Wells Cathedral is a privilege that we should aim to gift to future generations. The people who make and maintain are obviously key to the survival of the relationship between culture and community.

Stonemasonry points to an innate need to not only shelter ourselves with structures but create something beautiful out of them. It is a human quality to want to exist within a beautiful space - why should we deny ourselves that for ease and efficiency?

the Human Perspective: the Touristification of the High Street

By Karolina Pavlikova

Walking up and down the Royal Mile, a street connecting Holyrood Palace and the Scottish Parliament with Edinburgh Castle, every day on my way to university and back home, I have mastered the slalom around groups of tourists strolling the street slowly and glancing into the windows of shops. While for tourists the Royal Mile is the main attraction in the capital city of Scotland, a UNESCO World Heritage Site (Harwood and El-Manstrly, 2012), locals have found their own way of avoiding the street when necessary. For me, the route used to be similar each day. I walked the necessary stretch of the Royal Mile and, at the earliest opportunity, used one of the 'closes' to join a parallel street. While overwhelmed with university assignments and running for morning lectures, each day I passed a bakery, its front window decorated for each season. Each week I promised myself a visit once my assignments were done, but before the semester even ended, the bakes vanished, soon replaced by tartans, magnets and Harry Potter merchandise. This personal encounter illustrated a wider trend: the gradual replacement of independent shops by tourist-oriented souvenir stores.

The Royal Mile, Edinburgh's earliest settlement, was enclosed in 1513 by the Flodden Wall, forcing the growing population to expand upwards, some buildings reaching up to 15 storeys, rather than outwards beyond the wall. This period of Edinburgh's history is often associated with plague, overcrowding, filth and poverty. Despite the city's political and religious transformation, and its eventual expansion beyond the city wall, residents of the Royal Mile continued to experience hardship. By the late nineteenth century, two-thirds of the buildings along the Royal Mile—named as such only in 1901—were demolished and rebuilt by the council (Henderson, 2017). Today, the Royal Mile

continues to function as a stage for political and societal events. In recent years, the funeral procession of Queen Elizabeth II travelled from Holyrood Palace to St Giles' Cathedral along the Royal Mile (BBC News, 2021). It has also become one of the city's primary tourist destinations, accessed through open-top bus tours, haunted walking tours and Segway routes.

Societal change has had a direct impact on the infrastructure of the Royal Mile. The 2010s saw the disappearance of newsagents and the abandonment and vandalism of telephone boxes. Research by the Business School at the University of Edinburgh compares changes in businesses between 2011 and 2014, documenting a clear shift in use. A space once occupied by two charity shops (PDSA and Oxfam) was converted into a large tourist souvenir shop. Two newsagents, a grocer, an antiques shop and a musical instruments shop were all lost to multiple cashmere souvenir stores (Harwood, 2021).

In the present day, the Royal Mile contains none of the charity shops or independent retailers that were present between 2011 and 2014. There are a range of souvenir shops along the Royal Mile, each selling variations of cashmere, tartans, Celtic crafts and general memorabilia. As of 2014, there were 56 individual shops fitting into at least one of these categories (Harwood, 2021). Additional categories not included here are whisky shops and experiences, tourist cafés, the World of Illusions attraction, as well as seven museums along the Royal Mile.

The truth is that, outside of the remaining three churches, a kindergarten with a 29% fall in pupils since 2004 (Picken, 2025), and a university building still in operation, the Royal Mile has little to offer the majority of city residents. While in the past residents were crammed into the tenements of the Royal Mile, they have since been driven to the outskirts of the city, where housing has not been converted into holiday accommodation (Picken, 2025).

On a Sunday afternoon, I ventured onto the crowded streets of the Royal Mile to map the tourist infrastructure in 2025. Outside of encountering three bagpipers, a street magician and a dancing man dressed in a bunny costume, I examined every retail unit with street level access

and assessed whether it could be of benefit to local residents or primarily to tourists. Although cafés, pubs and historical museums are likely to be visited mostly by tourists, I excluded these uses on the basis that they could still serve a local function. I marked all souvenir shops selling at least one of the items outlined previously. To illustrate the shift in infrastructure, I compared this mapping exercise with the street in 2008, using Google Maps.

Looking at the maps carefully, we can see a general growth in souvenir shops, with a higher concentration towards the lower end of the Royal Mile, closer to Holyrood Palace. As of July 2025, there were 72 souvenir shops, representing a 29% increase over the past decade (Picken, 2025). To illustrate the scale of this growth, I photographed the façades of adjoining shops at two locations along the street. I repeatedly observed rows of souvenir shops selling near identical merchandise.

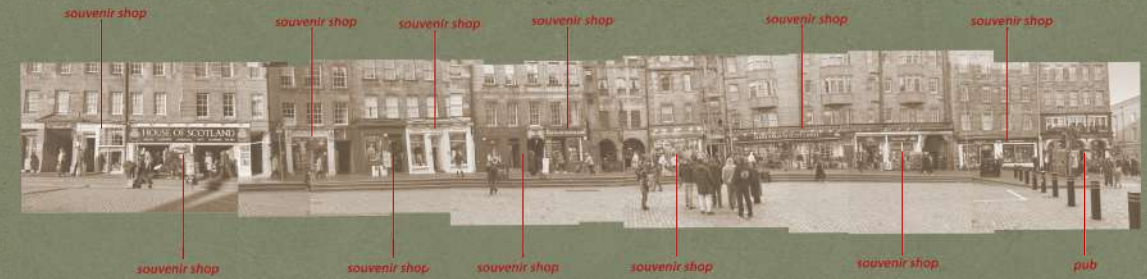

While I do not speculate on the profitability of these businesses or on any potential illicit uses of these retail spaces, the density of such establishments raises questions about their commercial character.

The competition for retail space along the Royal Mile may appear fair and economically rational, requiring businesses to generate enough profit to cover rent by selling goods people are willing to buy. Yet it is tourists, rather than local residents, who have increasingly shaped the unauthentic commercial character of the street. BBC reporting notes that Edinburgh Council owns and rents out 35 shops along the Royal Mile, including souvenir shops (Picken, 2025). The Council is also responsible for granting planning permission. This raises the question of whether applications for souvenir shops can be legitimately refused, or whether the tax revenue generated by these businesses influences decision making. Edinburgh's City Plan 2030 states that planning permission will be granted for development which retains and enhances character, attractiveness, vitality and accessibility, and contributes to its role as a strategic business and regional shopping centre and to Edinburgh's role as a capital city (City of Edinburgh Council, 2021). The general and open-ended nature of this definition may help explain how 72 souvenir shops now occupy a 1.1 mile stretch of the Royal Mile (Picken, 2025).

This raises a critical question: at what point does a visitor purchasing a fridge magnet contribute to the displacement of local communities from the city centre, as rising commercial pressures, inadequate infrastructure, and rising cost of housing make it increasingly difficult for them to remain?

In 2023, Edinburgh remained the second most visited city in the United Kingdom after London, attracting 2.3 million tourists (Edinburgh Inquirer, 2024). With a resident population of approximately 530,000 (National Records of Scotland, 2025), this places a disproportionate strain on the city's infrastructure. The City of Edinburgh has since introduced a 5% tourist tax on overnight stays from July 2026, becoming the first city in Scotland to do so. The extent to which this measure may reduce tourism or benefit residents will only become clear after its implementation. Accommodation costs are already considered high throughout the year, but

Invisible Architecture

By Audrey Sheung

Early in the morning at 8am, the studio is just the hum of laptops and the scratch of pencils on trace.

The sound floats through the space as white noise in the backdrop, heightening the expansive feeling of the large double height room;

and despite the emptiness in the studio, the clarity of each sound establishes a sense of ownership and focus. The space briefly feels yours.

Throughout the day, this same environment transforms. Footsteps begin to echo, chairs scrape against the floor, and the studio signals its awakening and the start of the day.

Pockets of chatters, giggles and conversations from tutorial sessions emerge across the room.

Voices begin to overlay one another, and the atmosphere suddenly gathers more energy and warmth within a space that now feels more compressed.

As voices start to rise and acoustic boundaries dissolve, it becomes difficult to distinguish the emergence of a particular sound.

Interestingly, these zones of acoustic density foster a shared attentiveness between individuals which ironically takes away from its distracting and claustrophobic qualities.

The same walls suddenly feel closer as sound fills every gap. Slower pace of keyboard clicks, rustling, and occasional sighs tells us the day is nearing its end.

The envelope seems to expand again while noise begins to dissipate away from the studio. Silence returns, although this time it is filled with a heavier determination compared to the morning's fresh quietness.

The spatial quality of a place may also be related to the architecture itself. Similar decibels levels in the library produce a starkly different effect. Soft chatter feels more aggressive.

The noise feels exposed within the lower ceiling and cellular configuration of the interior, where sound has nowhere to retreat.

Here, sound is disruptive rather than energising, clashing with the expectation of enforced quiet in a library. Different to how sound is experienced in an architectural studio

The difference in encounters despite both being spaces of work and learning epitomises how noise determines our experience.

It often reveals what walls alone hide - does the volume invite connection or isolation? Privacy or announcement of presence?

sound is the invisible architecture we forget to design, yet it is what quietly governs how we inhabit space

Human Inspiration

By Faheem Kathawala

The light shone bright far away
This night shall too pass one day,
Time always heals they say
The magical songs soon shall play.

The world has its own melody
The chirping of the birds is now my remedy,
Nature has its own symphony
A dream of mine to now breakfree.

Careful now!
A Crucial spot you hold,
One the whole world behold
And await the next stroke of gold.

But secrets I hold none
This road might not have been the one
I have not a trick to be undone
What shall I say I have done?

Just as I saw a gleam of light
I walked the edge and looked at night
The dove that guides is all so bright
This is what they used to write

Now the path I see
Is mine to stride,
An ordinary man and his
Dove of light

*In the world full of aspirations, try to be
someone's inspiration*

Your Body is a Temple

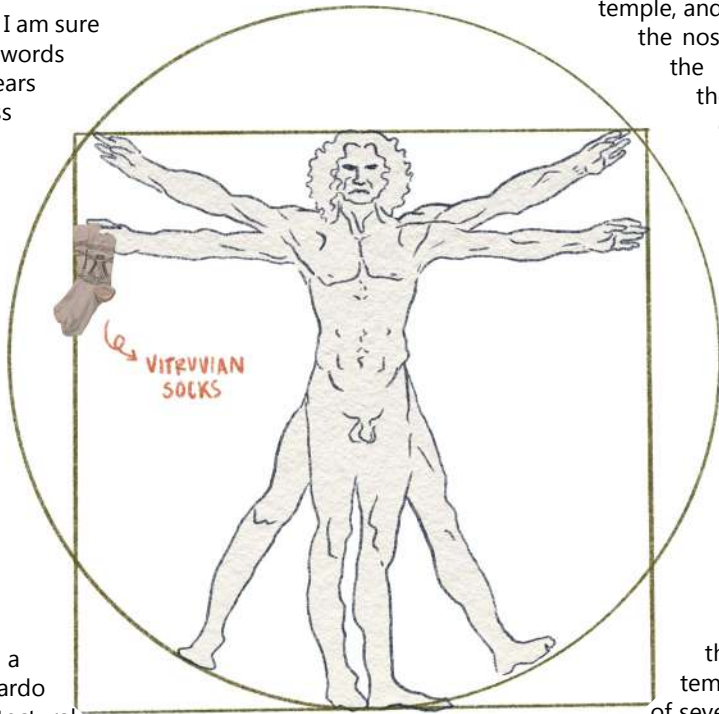

By Naomi Ren

Graphics by Ella Turner

"Your body is a temple" I am sure you have heard those words whispered into your ears plenty of times by fitness and food companies, but ever by an architect? Let's take a look at Italian architect, painter, sculptor and engineer Francesco Di Giorgio (1439-1501) and hear what he has to say.

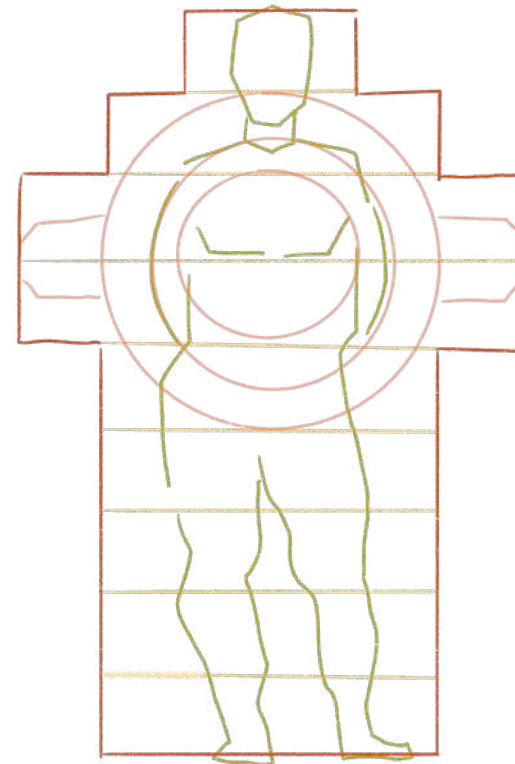

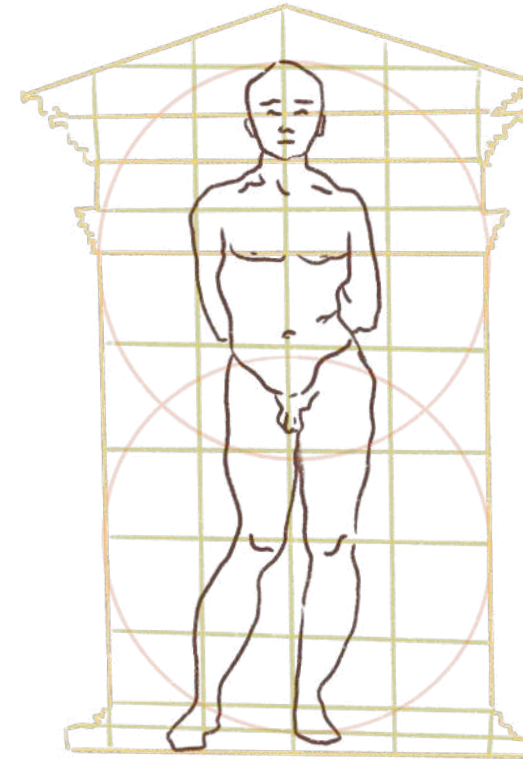

To set the scene, we can place Francesco Di Giorgio in the early Italian Renaissance, a contemporary of Leonardo Da Vinci. His architectural theory was rooted in scientific disciplines such as arithmetic and geometry, and complemented by drawing, creativity and invention — a vision shared by many fifteenth century architects. Citing Aristotle, Francesco explains that art acts in accordance with nature, therefore, he bases his designs on the underlying order of the natural world. He believed that architectural proportions should be derived from the human body.

The famous "Vitruvian man" by Leonardo Da Vinci (Yes, the pattern on my socks), depicts the proportional theories of human anatomy, devised by the Roman architect Vitruvius. However, a less well known anthropological theory of proportions is Francesco's use of a modular grid, in which the human body proportions are used, to create the plan of a temple.

As shown in his sketch (opposite, bottom), the circle touching the nose and bottom of the torso gives the width of the temple, and the distance from the nose to the crown of the head configures the hemicycles on either side of the crossing. But that is not all, the facade is also obtained through proportions of the human body. The head is used as the measurement of one unit. As shown in the opposite top left image, the height of the temple is composed of seven and a half units, and the base of the temple is four units wide. Furthermore, half-unit divisions indicate the location of architrave, frieze, and cornice; or alternatively chest, neck and frieze, and cornice; or alternatively chest, neck and face (see opposite top right).

Classical architects dedicated their lives to determining mathematical procedures to obtain visual harmony in order to rationalise beauty. They believed that the key to beauty lay in proportions, proportions found in nature, and looking back at the magnificent architectural masterpieces they produced, perhaps they were on the right track. Ultimately, the fact that our bodies are where they sought perfection and inspiration leads to one irrefutable proof: we are beautiful and our bodies are art.

Human as Producer

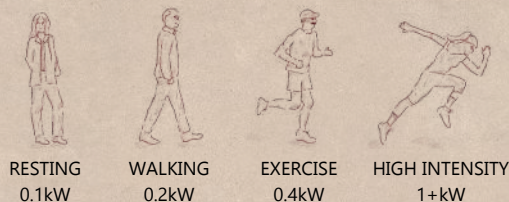

By Daniel Aschenbrenner

Graphics by Arianna Holmshaw

Being human comes with a set of instincts that drive our unconscious behaviour. One of these is social thermoregulation. More commonly known as huddling or cuddling, it is the instinct to warm up through proximity with others. The underlying science is human body heat. On a small scale, the quantity is arguably negligible. Yet, if this phenomenon is brought to the scale of a building and its many users, the accumulated body heat can amount to a significant quantity. Whether that quantity can make a difference is the centre of this piece.

Setting the Context

Humans require energy to stay alive. This energy is obtained through metabolism. Body heat is a byproduct of metabolism and is used by the body to regulate internal temperatures to maintain a stable core temperature. Hence, if the exercise performed is of higher intensity, the body will release more body heat to compensate for the increase in the core temperature caused by the exercise.

BODY HEAT BY TYPE OF ACTIVITY

To calculate the amount of body heat in a space, two variables have to be factored: the number of people in that space and the intensity of the activity they are performing. This body heat, if harnessed properly, can be used as a source of energy.

This theory has been tested in a select number of real life projects. One of these exploits the former part of the equation: the number of people in a space. Stockholm central station sees thousands of commuters every day of the year. Originally, this heat was being removed by the ventilation systems, wasted away. In an attempt to make that waste useful, a heat exchange system was installed that captures the body heat and converts its thermal energy into hot water. This hot water is pumped to a nearby office building to contribute to their heating. This system was installed in 2012 with the aspirations of harnessing enough body heat to reduce the heating demands of the office building by 15%. Upon completion, the results went beyond the expectations, with a 25% reduction in heating demands (El Sayad, Farghaly and Hamada, 2017). For an office building of such scale, this represents both a significant cut in costs and a step away from fossil fuels.

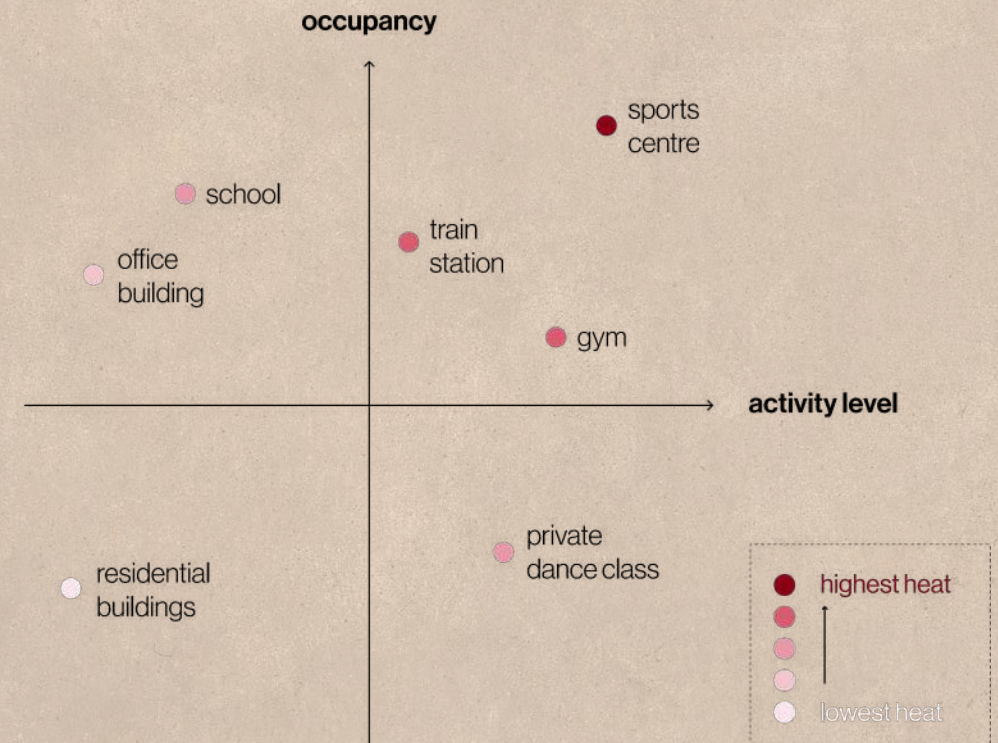

The other significant project exploits the later part of the equation: the level of activity in a space. SWG3, a venue in Glasgow, puts on shows with big crowds in a repurposed warehouse. They developed a system which traps the dancer's body heat with ceiling mounted units, and converts it into hot water; not dissimilar to Stockholm's system. What makes it different is how it stores the energy. Instead of pumping it to another building, it transfers the heat to twelve 200 meter deep geothermal boreholes. It stores it

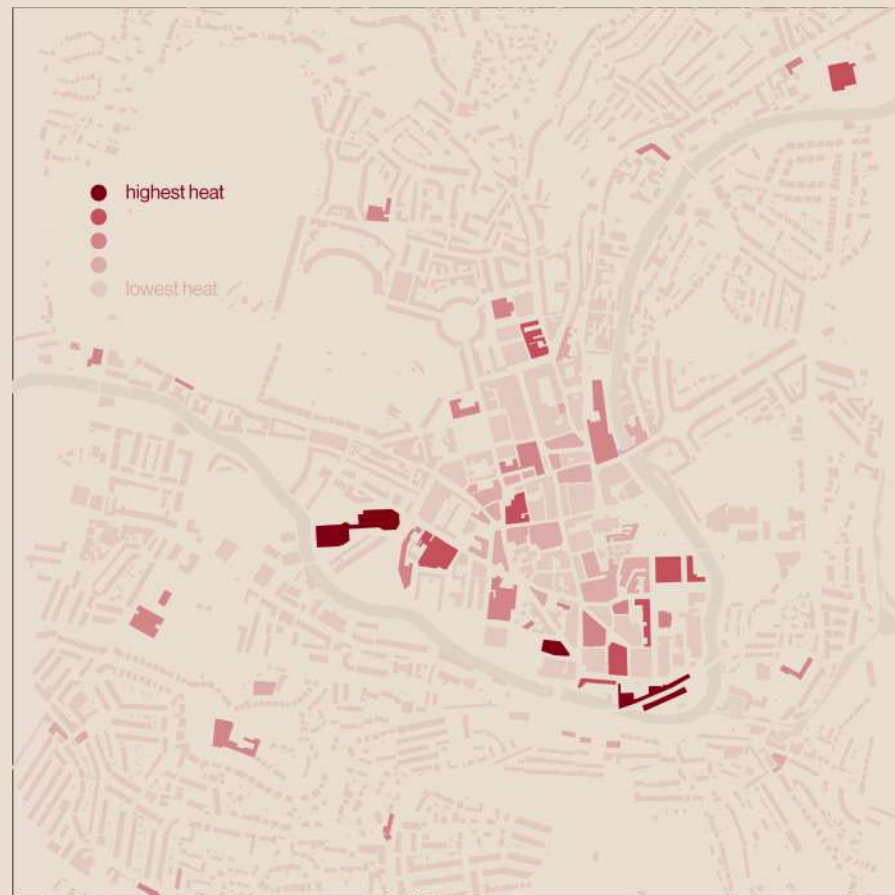

there until it is needed in a less populated zone of the building (Malpas, 2022). What is interesting about these two systems is that they acknowledge how different spaces take different roles in the harnessing of body heat. Highly populated spaces become producers and sparsely populated spaces become consumers. SWG3 uses this logic in the context of a building and its internal spaces. But what if the same logic could be expanded to the urban scale? Instead of spaces, it would be buildings that are seen as consumers or producers of body heat.

Scaling up

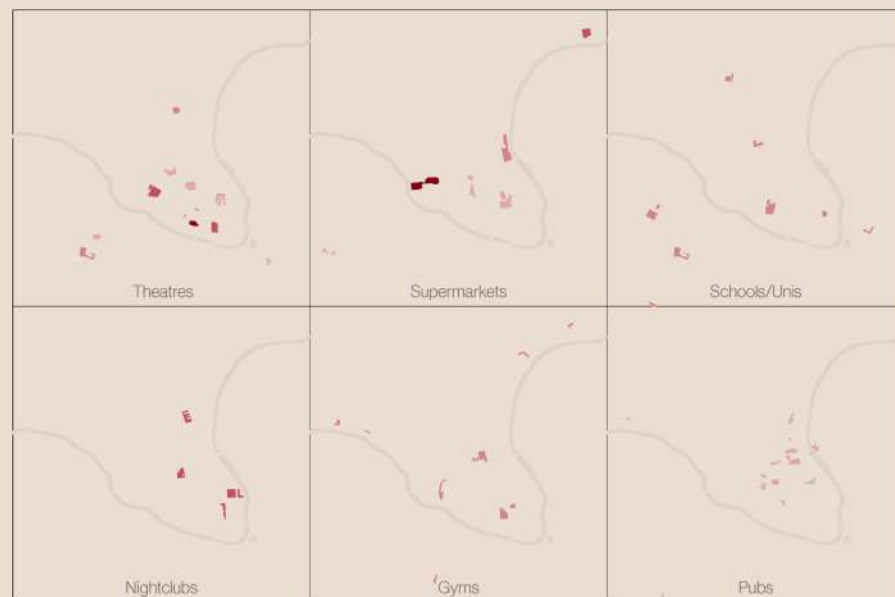

Scaling up to the urban scale means we need to think in terms of macro human behaviour. The goal is to identify where humans congregate in large numbers. To understand the where, it is first essential to understand the why. Some reasons for large congregations might be necessity driven. This is the case in train stations for the need of transport, or in hospitals for the need of medical assistance. Other reasons are more socially driven. Humans are attracted to large

crowds. The uniting of many souls towards a common purpose is a phenomenon that is pervasive throughout history and continues today in the form of concerts halls, stadiums, fairs, bars... By understanding this social behaviour, we can map out an urban landscape to show buildings with higher and lower occupancy as well as the level of activity occurring in each place, using the full picture to classify buildings as producers or consumers. As a result, the highest heat spots will be buildings that have considerable occupancy whilst also having users that are, to some degree, active. The lowest heat spots will thus be residential buildings, as these have both low occupancy and, typically, lower activity levels. Now that we have mapped consumers and producers, the connection between them needs to be studied. It is relevant because of the impact the transfer of energy can have. A transfer of energy inevitably comes with losses. Part of the equation is technology dependent, such as the insulation of pipes. The other part is geographic, namely the distance the energy travels from the capturing to the releasing. This latter consideration has heavy architectural and urbanistic implications. The question at hand is whether the urban layout is optimised to create

Bath Body Heat Map

efficient links between consumers and producers. And if it isn't, what can be done to optimise it? To answer that question, the city of Bath is used as a case study.

Conclusion

The ballpark results show that Bath Spa could power 23 homes while Second Bridge could power 22 homes. Considering that this comes from our bodies - a renewable energy - this figure is considerable. Yet, what is more interesting than the results, are the variables used in the process. By finding ways to increase the first three variables - energy per person, time and people - and decrease the last two - losses and heating needs - we can optimise the number of homes powered.

What is more, the process can be extrapolated to other cities with other situations. That was the intention of this study. Not to produce exact figures but rather to show the possibilities in our hands. What is needed now is more research into all the variables to see how far we can harness human body heat. How do we bring more people to congregate in one space? How can we increase people's level of activities in these spaces? How can we make them stay longer? What mechanical solution would lead to less losses in energy? Can the heating needs per home be reduced? The potential is there. Further research is coming.

energy per person	0.25kW	0.45kW	<i>body heat for walking/dancing</i>
time	12min	3hrs	<i>time spent per person a day</i>
people	18400pax	615pax	
total energy	920kWh	830kWh	
losses	-384kWh	-281kWh	<i>mechanical limitations & distance to homes</i>
heating needs	25kWh/home		
homes powered	23	22	

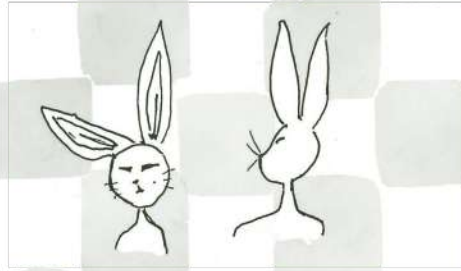

CALCULATION FOR HOMES POWERED BY BODY HEAT IN BATH SPA AND SECOND BRIDGE

the Most Wholesome Bank Robbery You will Read About

By Aditi Kundan

I recently read *Anxious People* by Fredrik Backman, and safe to say, it has become one of my favourite books of all time. With a plot that seems to have been born out of one of my many wild dreams, this book will surely surprise you, in the best of ways.

A poignant comedy about an unsuccessful bank robber that disappears into thin air, two very confused policemen and eight anxious, terrible hostages - who were simply in the wrong place at the wrong time - this book delves into the anxieties of everyday life, and how everyone around us is trying to go about their lives in the best way they can. The plot summary may make it sound like an action-packed heist genre, but believe me when I say it's more slice-of-life comedy, than an on-the-edge-of-your-seat comedy.

One of the best things about the book is how it manages to make the reader curious about the fate of the characters, without having a grand, mysterious plot. The author, Fredrik Backman, includes multiple different perspectives in an expert manner, adding complexity and layers to each chapter, while maintaining an easy-going tone throughout the text.

One of the more heartwarming features about the book is definitely the characters. These characters, although vastly different from each other, are so well fleshed out that it leaves you wanting for more. Even characters that come across as cold and unlikeable, are written in such a brilliant manner, that it makes you want to root for every single one of them - you will find yourself laughing and crying with, feeling their frustration and apprehensiveness, while also being vastly entertained by their idiosyncrasies.

Other than being a fantastic read, this book takes you on a journey of the complexities of human nature - it's a refreshing perspective that made me appreciate the lives of those around me. In simple words, this book is a physical rendition of 'people watching', except you can peek into their thoughts and understand the beauty of each individual around you.

I would definitely recommend you to go into this completely blind (which is what I did), in order to be able to enjoy it to its fullest potential. Lastly, as a small reminder, don't forget to be respectful and appreciative of those around you, because, as Backman adds in his book:

"We plant an apple tree today, even though we know the world is going to be destroyed tomorrow. We save those we can"

"We need to be allowed to convince ourselves that we're more than the mistakes we made yesterday. That we are all of our next choices, too, all of our tomorrows"

A RELIC
OF THE
PAST?

OR A
WINDOW
TO THE
FUTURE?

the Art of Kigumi: a Relic of the Past or a Window to the Future?

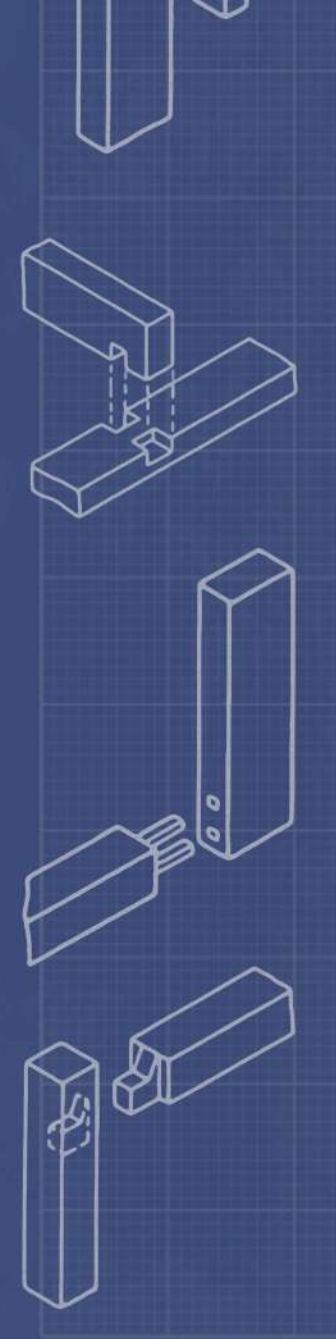

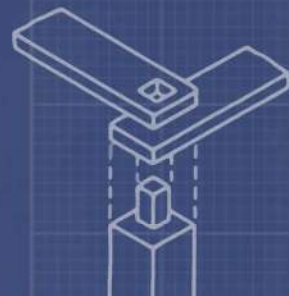

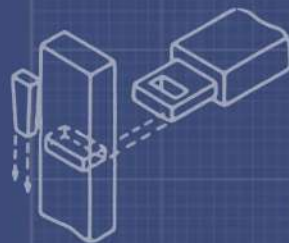

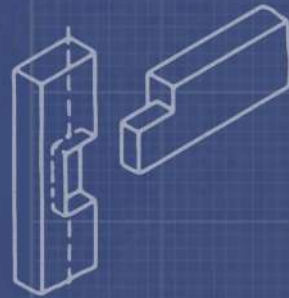

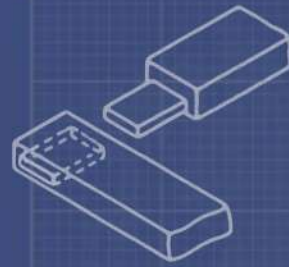

By Alex Zheng and Katie Townsend

Graphics by Isabella Turner

Kigumi is a unique sect of Japanese carpentry, in which joints are constructed without the use of nails or adhesives. Both sturdy and beautiful, it is said to have begun in Japan's Heian period (794AD - 1184AD) as a response to the limited availability of high quality metal and the need for resilient joinery that could withstand forces applied by earthquakes and severe temperature changes.

The craft centres around hand-carving opposing pieces that slot into each other perfectly, with Kigumi carpenters utilising a thorough understanding of the timber that they work with and carving along or against the grain depending on both the needs of the joint and the tendencies of the wood. The art is constantly evolving, with new understanding of concepts, such as the strengthening properties of lignin fibres within timber. These allow Kigumi craftspeople to create joints with greater stiffness and longer-term strength.

Whilst notorious as a historical craft, the intricacies of Kigumi offer us great possibility for the future. Naturally resilient, ARCH20 states that a properly cut mortise and tenon joint made from Japanese oak in the Kigumi fashion can withstand more than 2400N of lateral force without failure, making it a possible future competitor for steel but with a much lower embodied carbon. The small gaps in the hand-cut joinery allow the structures to survive earthquake tremors by effectively absorbing the seismic forces, making it an optimal choice for buildings in seismically unstable regions. These gaps also allow the timber to expand and contract without the joint breaking, permitting greater temperature and humidity changes before destruction. In a world increasingly driven by the necessity to respond and adapt to changes in climate, Kigumi appears a fine choice for resilient timber joinery.

The beauty of the craft lies in the care taken to respond to the materiality of the timber.

Kigumi reminds us to take a step back and embrace the quality of the materials that we already know and love, instead of constantly pushing for more.

Surface Reflections

By Remi Kairm

PART 3

Surface reflections: the theme of last summer's London Design Biennale. When faced with the chance to hold a mirror to yourself, your culture, and your reality, **what do the reflections look like?** The theme was used by pavilions and designs alike to reveal something of human nature, contrasting and layered, expressing the internal and external **experience of being human, and a part of something.**

Records of Waiting: On Time and Ornament

Through the exploration of the shared experience of waiting, Poland discussed that, though we all wait, how long we wait and how we wait is not equally distributed amongst society.

Along a narrow room, a sequence of twelve wooden panels were presented, where each panel represents a different waiting scenario, engraved using traditional Polish highland techniques, with the time it takes to wait, from 21 minutes, the average time people in Poland wait for an ambulance, to 6,837,120 minutes (13 years), the average time to pay off a mortgage.

The visual embodiment of time is presented, making time feel more like a tactile entity. They chose a variety of waiting situations, hopeful waiting, oppressive waiting and boring waiting. The pavilion gives language to the relativity of time and is described by one of the designers as 'an ornament of lived time'.

Wura

Wura is a pavilion about wealth and the perception of the global south, amplifying its history. It is made of two of the most prevalent trading units: cowrie shells and gold. The structure is a cylinder frame with gold chains and cowrie shells suspended from it, forming a visual juxtaposition between the two currencies. The gold chains also represent the nature of the global south, one imbued with strength, value and power. Cowrie shells were the most used in Africa, Asia and the Americas in the past; the shells represent the connection between places.

The pavilion is also an exploration of how the past can define the present as well as inform the future. So while gold became the preferred trading language, there is something beautiful and unique in the way the cowrie shells stand out against the gold in the pavilion - it suggests the Global South will not be silenced or forgotten.

The theme of surface reflections allowed for a multifaceted look into **what it means to be a human** and how society functions. Each pavilion from countries, designers and universities brought their own take, each allowing the person to become fully immersed in **culture** and **thought**.

the Sustainable Effects of Fun : Place Attachment

By Oliver James Greenaway

It might be a bit unusual but I still follow my old school on Instagram. I don't see their posts enough to justify unfollowing them but every once in a while they come up, and I'm glad to see it's still kicking. The last GCSE cohort came back a few weeks ago to celebrate their results and look back on some of their memories. I've been gone long enough now that I don't recognise any of the kids in the photographs, or any younger siblings of my old friends, and as the years have gone by, I recognise fewer and fewer teachers. One thing, though, is slower to change: the buildings they're inside. The assembly hall has the same layout as when I left, even if it does look a lot smaller in those photos than years before.

If we were back inside that room right now, I'm sure I could show you, without hesitation, the tiny attic I had my piano lessons in every week, right

next to the art classroom, the sports hall where I aced a bleep test, or the DT room where I made a shoddy little tealight holder and talked back to my teacher a lot more than I'd care to admit. If there comes a day when I drive by on my way to visit my grandma, and see a large 'modern' block of classrooms has taken the place of all these memories, I think I'd be, quite rightly, peeved.

I imagine this rings true for anyone who sees environments from their childhood changed, altered or demolished beyond recognition. We form intimate connections with these places over the course of the formative years of our lives and to see them ripped up in favour of something 'new' and supposedly 'better' feels a bit like a spit in the face to all those fond memories you've made there. For me, there's a comfort in knowing that the childhood I enjoyed is still there, ready for someone else to experience the same joy even years later. Of course, there are sometimes good reasons for some of these changes; currently, of the 518 projects under the government's school rebuilding programme, many are listed due to structural problems and safety concerns (Department for Education, 2025) which, of course, require fixing. However, the fact that many of these buildings will be torn down due to a lack of foresight into the lifespan of their structural system goes to show the importance in designing buildings to last.

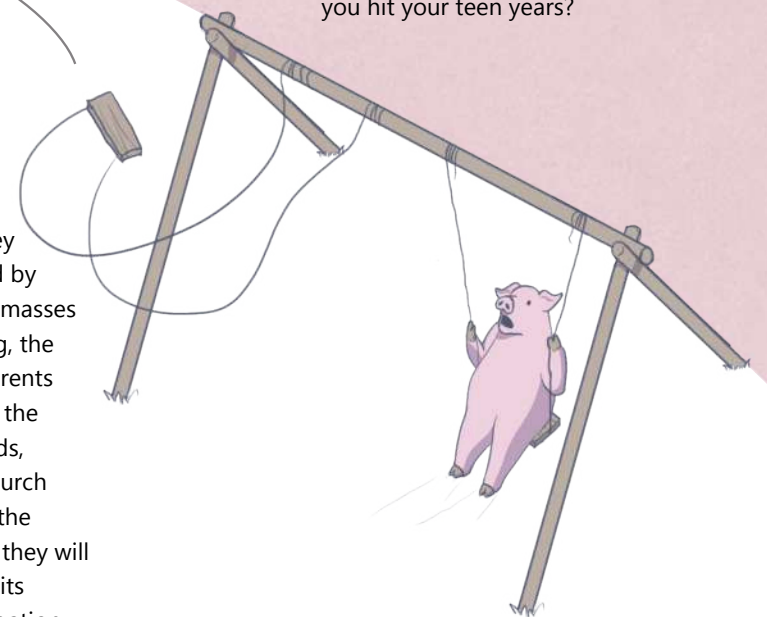

Using fun memories to foster a deeper attachment to an environment is something I believe architects need to consider more strongly in their design process, especially as an underutilised tool for sustainability. Our attachment to certain places creates a familiarity that causes "not just a detailed knowledge, but a sense of deep care and concern for that place" (Relph, 1976, p.37). Obviously there are other, more impactful tools for this fight against the effects of climate change, but this place attachment ensures spaces outlast their original use by giving people another, more personal reason to fight against their demolition. It goes without saying that people are more likely to remember unique experiences, and this should extend to their memories of unique buildings, too. As the construction sector accounts for 37% of global emissions (UNEP, 2023) and it seems we're getting further past the point of no return for climate change, it's more important than ever to look to increase the lifetime of a building - even through unconventional means.

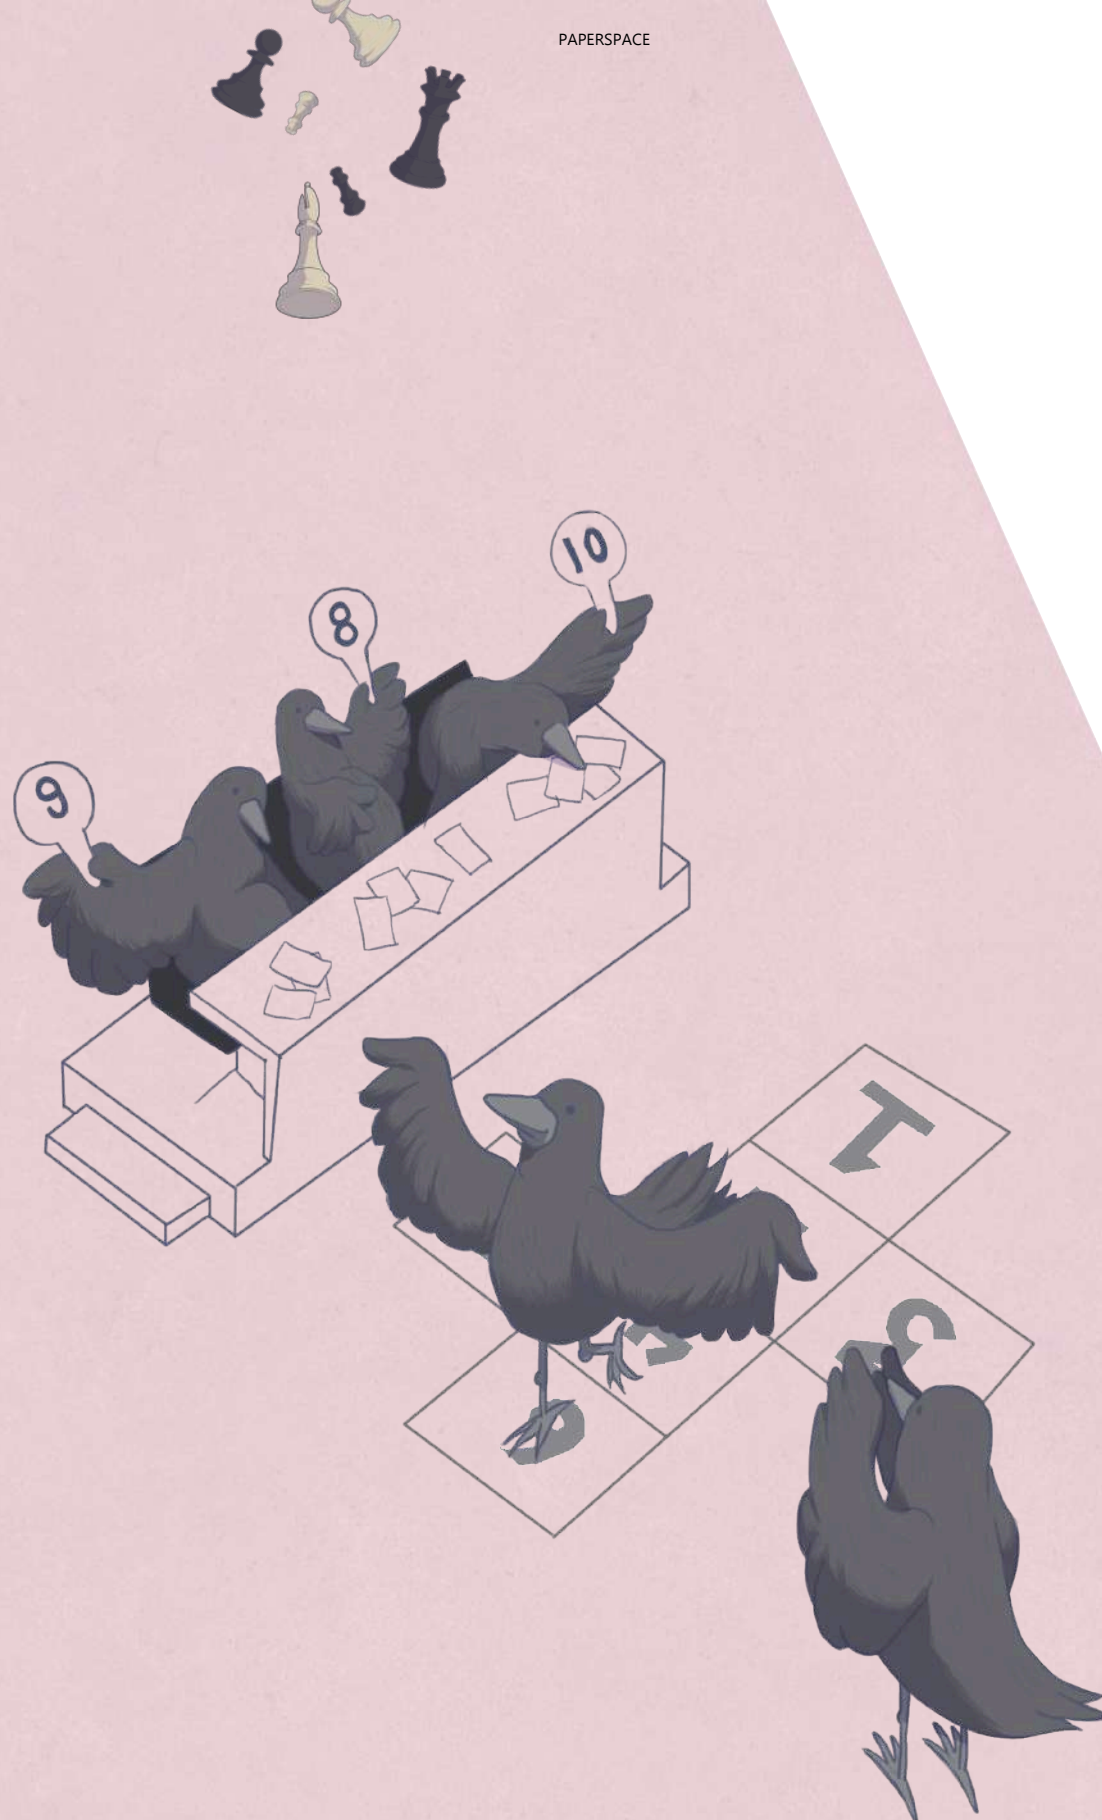

Schools, parks and recreational areas are clearly the most obvious examples of where this can be employed, but the principle isn't limited to just these sectors. All public buildings should try to strengthen their ties to, and the social cohesion within, the localities they inhabit. There's a saying thrown around by older Mothers and Grannies at church masses that I quite like, 'if you don't hear crying, the church is dying'. It's for when young parents get embarrassed by their kids crying at the back of the congregation. In other words, children must be integrated into the church community from a young age, despite the disturbance this may cause. Otherwise, they will grow up without a deep connection to its community, and the size of the congregation

will shrink in years to come.

Why then, do we not think of the rest of our public environment with a similar philosophy? Why are children corralled into play areas inside parks, purpose-built leisure facilities and youth centres, away from the rest of polite society? Fun design should be incorporated into all public-facing designs. It fosters the creative imagination of a younger generation and allows them to form core memories with a particular place. These unique spaces can not only inspire creativity in the minds of children, but adults too. It reminds them of the value in making bold decisions and can inspire unconventional solutions to problems through a visual example.

Not to mention, fun buildings are just that, a bit of fun! This is, in my opinion, the most important aspect of a human-oriented design, as it's the most 'human' part of us all. We all intrinsically know this; when we see animals playing made-up games with one another we might say they're acting like children - but really we mean human children. The very act of having fun makes us see these animals as more intelligent and more capable, because we recognise the act of play as a key stage in the development of one's creativity and social abilities. Why should this stop once you hit your teen years?

An abundance of well-used and well-maintained public buildings for all can work to strengthen the wider social fabric of an area through providing a sense of community and belonging amongst its members. This can pay dividends in years to come by reducing the loss of young talent through a greater access to opportunity, built by this shared community network, and a greater attachment to their hometown.

In *Place and Placelessness* (1976, p.33) Edward Relph asserts that "the commonly experienced messages and symbols of the landscape [...] serve to maintain [...] a collectively conditioned place consciousness, and this gives the people from a place essentially the same identity that the place itself has, and vice versa". In other words, there is a shared identity that comes from existing within the same environment as others, which goes on to lead to an increased feeling of belonging. He goes on to state that "in both our communal and our personal experience of places there is often a close attachment, a familiarity that is part of knowing and being known here in this particular place. It is this attachment that constitutes our roots in places" (Relph, 1976, p.37). These roots are what cause someone to stay (and care for) a place.

Of course, alongside other reasons, designing to mimic and inspire a child's sense of wonder is hard. Picasso even said, "When I was the age of these children I could draw like Raphael: it took me many years to learn how to draw like these children" (Ratcliffe, 2016). This, paired with the lack of a measurable metric, budget considerations, and differing client tastes can make incorporating fun hard to do. Despite this, I would still argue that designers and architects should take it on themselves to push for this change and involve fun in their designs as an instinct.

In years to come it will be the buildings with the most strongly considered designs now - not only through their hard, data-driven approach to environmental strategies, but also their soft approach to their users' experience - that remain standing.

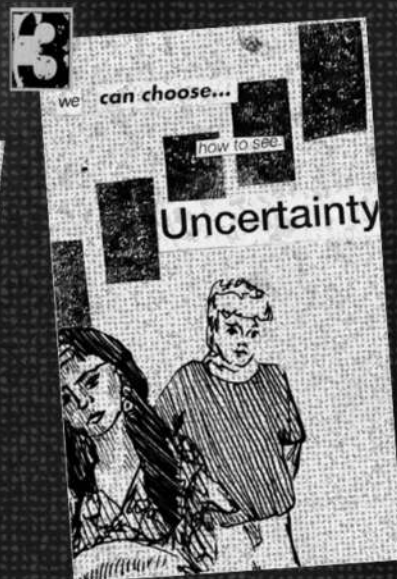

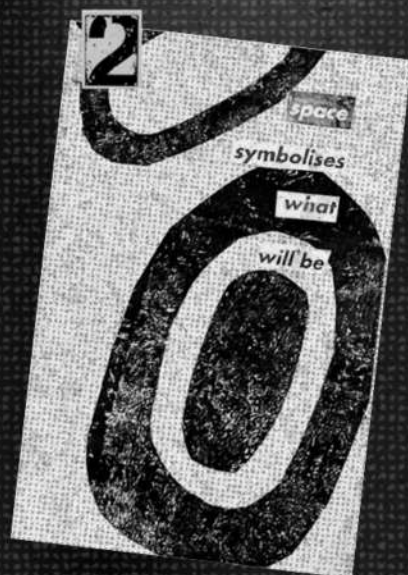

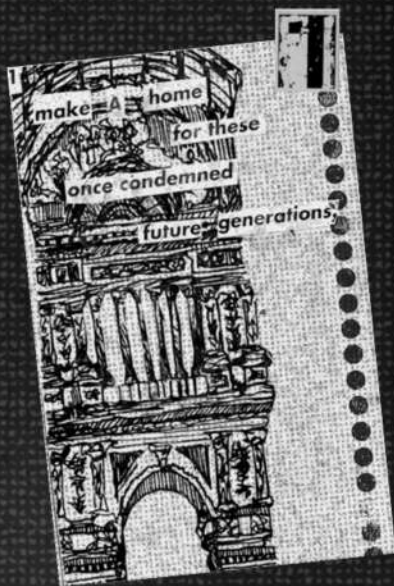

One cannot exist without the other.
